

API Vulnerabilities Report

Vulnerability Details

URL	https://reqres.in/api/users?page=2
Severity	High
Title	Broken Authentication and session management
Req_Headers	{'Content-Type': 'application/json'}
Req_Body	
Description	API does not perform any authentication for functionality that requires a provable user identity or consumes a significant amount of resources.
Remediation	Developers frequently build custom authentication and session management schemes, but building these correctly is hard. As a result, these custom schemes frequently have flaws in areas such as logout, password management, timeouts, remember me, secret question, account update, etc. Finding such flaws can sometimes be difficult, as each implementation is unique.
